A new technology sculpts and shapes

Posted Tuesday, January 02, 2007

Arasys III, invented and built at London University by the co-inventor of the pacemaker, is an electronic device designed for fast muscle building, inch loss, body shaping and reduction of the appearance of cellulite.

Originally designed to treat Multiple Sclerosis, the Arasys enhances your gym regime and increases your stamina by taking you straight to the fat-burning stage and eliminating the gym burnout feeling we all dread. The Arasys III, which naturally increases metabolic rate to initiate weight loss, is perfect for spot training to target trouble areas that cannot be conquered with standard exercise.

Arasys: See what all the buzz is about

Posted Sunday, January 14, 2007

Among the results actual Arasys users saw:

In 17 minutes, one patient lost:
4 inches from the diaphragm
2 inches from the waist
1 inch from the left leg
1.5 inches from the right leg

In 2 17-minute treatments, another patient lost:

4.2 inches from the diaphragm
3.2 inches from the waist
5 inches from the stomach
1.7 inches from each leg

We were overwhelmed by your comments to our first posting about the Arasys III, so here's some more information that'll make you want it even more! Here's how it works: Arasys is designed to exercise the muscles effortlessly, since it does not require glucose, which is normally utilized during exercise. This is important, because the body burns surrounding fat cells without decreasing glucose levels. This prevents the build-up of lactic acid, which causes that sore feeling you may get after working out. Arasys exercises the body similar to strenuous exercise, without perspiration or raising body temperature.
